## Education

**The University of Texas at Austin**, M.S. in Computer Science, GPA: 4.0 Aug 2024 – May 2026

- **Coursework:** Natural Language Processing; Deep Learning; Android Programming; Reinforcement Learning

**University of California – Irvine**, B.A. in Business Economics & Intl. Studies Sep 2018 – Jun 2022

## Technologies

**Languages:** Python, JavaScript, TypeScript, HTML/CSS, SQL

**Technologies:** React, Next.js, Vite, Redux, Express, Apollo, GraphQL, Django, Flask, FastAPI, FastMCP, Git, PostgreSQL, PyTorch, Kotlin, Supabase, Docker, SimPy, Streamlit, Hatchet, Porter, Redis, Claude Code

## Experience

**Forward Deployed Engineer**, Handshake – San Francisco, CA Aug 2026 – Present

- Build and deploy production AI agents for enterprise clients on Handshake AI's Enterprise team, translating customer workflows into agentic systems
- Own end-to-end delivery: scoping requirements with customers, designing agent architectures, and iterating against evaluations to reach production quality

**Founding Engineer**, Usul – San Francisco, CA Jan 2026 – Jul 2026

- Built AI-powered search using an MCP server to query contract data, and engineered LLM workflows to automatically surface relevant contract recommendations to customers
- Designed backend architecture to scale from seed to enterprise, including CI/CD workflows, migration management, ORMs, backend service layers, and AI orchestration
- Cut frontend load times by 50% via cache invalidation and real-time cross-client updates using server-sent events
- Designed and implemented RBAC and RLS policies to secure the platform across services such as MCP and HTTP

**AI and Data Science Intern**, Nouryon – Houston, TX Jun 2025 – Aug 2025

- Designed a digital simulation for a multinational chemical manufacturing product line using years of historical data, identifying process bottlenecks to recommend cost-saving improvements

**Full Stack Software Engineer**, Apero Health (YC Startup) – San Francisco, CA May 2023 – Jul 2023

- Designed a dynamic forms builder enabling healthcare clients to generate HIPAA-compliant forms
- Reduced legacy code duplication by 80% by overhauling the frontend to use a centralized component library

## Projects

**Lister** [github.com/WhirlyFan/Lister](https://github.com/WhirlyFan/Lister)

- Full-stack MyAnimeList clone with live chat via WebSockets, followers, anime lists, and reviews using React/Redux, Flask, and SQLAlchemy

**Breezy** Apr 2025

- Built an Android app in Kotlin modeled after Instagram, with Supabase auth, real-time messaging, and PostgreSQL triggers and functions

## Research

**Enhancing Natural Language Inference Robustness Through Adversarial** Dec 2024

### Dataset Fine-Tuning

- Fine-tuned an Electra-small model with adversarial datasets, achieving an 8.09% accuracy increase on out-of-distribution data, demonstrating improved robustness and generalization
